

E28-P1 Harness

Products that can use this harness

- Orion2, Orion, Saturn, Pluto, Venus, Titan

History

- This old style Level 1 harness was made to splice another ECU into an existing Spitronics Harness. Firmware like the CAM Control required only the RPM and TPS signals. This was done where the existing ECU did not have enough outputs for all the tasks.

Design Points to take Notice of.

- It has only the Crank RPM signal and TPS Input Signal. Both ECU earths must be tied on the same earth point. These wires are not shielded and should be close to the other ECU.

Wire Names and connections on this harness:

RPM Input Signal (Green)

TPS Input signal (Yellow)

+12V Ignition (Red)

See the design drawing for thickness and lengths of wires. See the connection drawings in the specific product manual on how to connect the harness to each item it was designed for.

NB! Wires that are not connected must be isolated to prevent shorts or interference.
